

# Cirris OPC UA Server Beta Release

## Integrate Your Cirris Tester Into Plant Floor Automation and Reporting

OPC UA is a communication standard for integrating equipment and processes on a plant floor. The Cirris OPC UA Server application can be enabled for use with Easy-Wire software. While Easy-Wire runs on a test station, OPC UA Server can report real-time tester status and control basic tester functions. As an example, an Excel spreadsheet like the one below can be updated with real time test information from one or more Easy-Wire stations in use.

In this case, Excel is installed on a network station with OPC UA client software, which monitors a Cirris OPC UA Server and updates Excel. Real-time test information can be simultaneously transmitted from one or multiple Easy-Wire stations that have OPC UA Server enabled. The OPC UA communication standard presents a positive framework for future plant floor automation and process communication.
